

Supplementary Fig. 1. Standardized mean difference between the sugammadex and non-sugammadex groups before and after propensity score matching. The standardized mean difference of several variables was ≥ 0.1 before propensity score matching. However, the standardized mean differences of the amount of intraoperatively administered crystalloid, anesthetic duration and intraoperative transfusion were ≥ 0.1 after matching, and the standardized mean differences of other covariates tended to decrease. COPD: chronic obstructive pulmonary disease, MI: myocardial infarction; Na: sodium, K: potassium, Cl: chloride, P: phosphorus.
